## Potential Conflict of Interest Disclosure

I disclose the following financial relationships with commercial entities that produce health care-related products or services relevant to the content I am planning, developing, or presenting:

<u>Company</u>	<u>Relationship</u>	<u>Content Area</u>
GSK	Consultant	Vaccines
Merck	Consultant	Vaccines

Past and present funding from: NIH, PATH, Bill and Melinda Gates Foundation, Meningitis Research Foundation, Pfizer, Astellas

Member, Board of Directors, Corner Therapeutics

Member, Scientific Advisory Board, Amplitude Therapeutics and Limmatech

# Outline

1. General (primarily pneumococcal) vaccine concepts
2. Development of a platform and examples of applications
3. Development of a biotechnology company
4. Epilogue

# Background

- Born in NYC
- Moved to France age 4
- Journalist father expelled from France in 1980, returned 1981
- College in US 1982, “temporary”
- Med school Tufts 1986-90
- Internship, residency, fellowship in ID and ER and stayed at BCH ever since
- Primary focus on early vaccine development, with emphasis on vaccines for LMICs

# M&M analogy

## Pneumococcus Bacterium

### Protein Core

- Virulence factors
- Polysaccharide surface protects protein core from host's defenses

### Sugar Coating

- Polysaccharide outer surface critical in distinguishing various strains of bacterium
- 100+ different serotypes of pneumococcus
- Diverse sugar surfaces require multiple valencies in a vaccine to combat bacterium

# Pure polysaccharides are immunologically boring

Pure polysaccharide

T-cell  
independent  
(humoral)

IgM, IgG short-lived  
Ineffective in children

# Protein-Polysaccharide Conjugate Vaccines

A protein is chemically conjugated to a polysaccharide and injected into the body to teach the body to recognize the polysaccharide as a part of a harmful invader.

\*Images courtesy of the CDC website

# Conjugate vaccines are much more immunologically exciting

Pure polysaccharide

IgM, IgG short-lived  
Ineffective in children

T-cell  
independent  
(humoral)

Pure polysaccharide

+

Conjugated carrier  
protein

T-cell  
dependent  
(humoral and  
cell-mediated)

Robust IgG with memory  
Highly effective in children  
First one: Hib conjugate  
(Anderson and Smith,  
originally from BCH)

## February 17<sup>th</sup>, 2000: US FDA approves the licensure of a seven-valent pneumococcal vaccine (PCV7, Wyeth/Pfizer)

Since then:

- PCV10 (GSK) in Europe in 2009
- PCV13 (Pfizer) in US in 2010
- PCV13 (Walvax) in China in 2019
- PCV10 (SII) in India in 2020

Recently licensed for adults, infants and children:

- Merck's PCV15
- Pfizer PCV20
- Merck PCV21 (adult only)
- Other vaccines in development

# Some issues with pneumococcal vaccine conjugates (PCV)

## 1. Serotype replacement

*I'm fed up with this guy -  
let's become pathogenic*

## 2. Cost

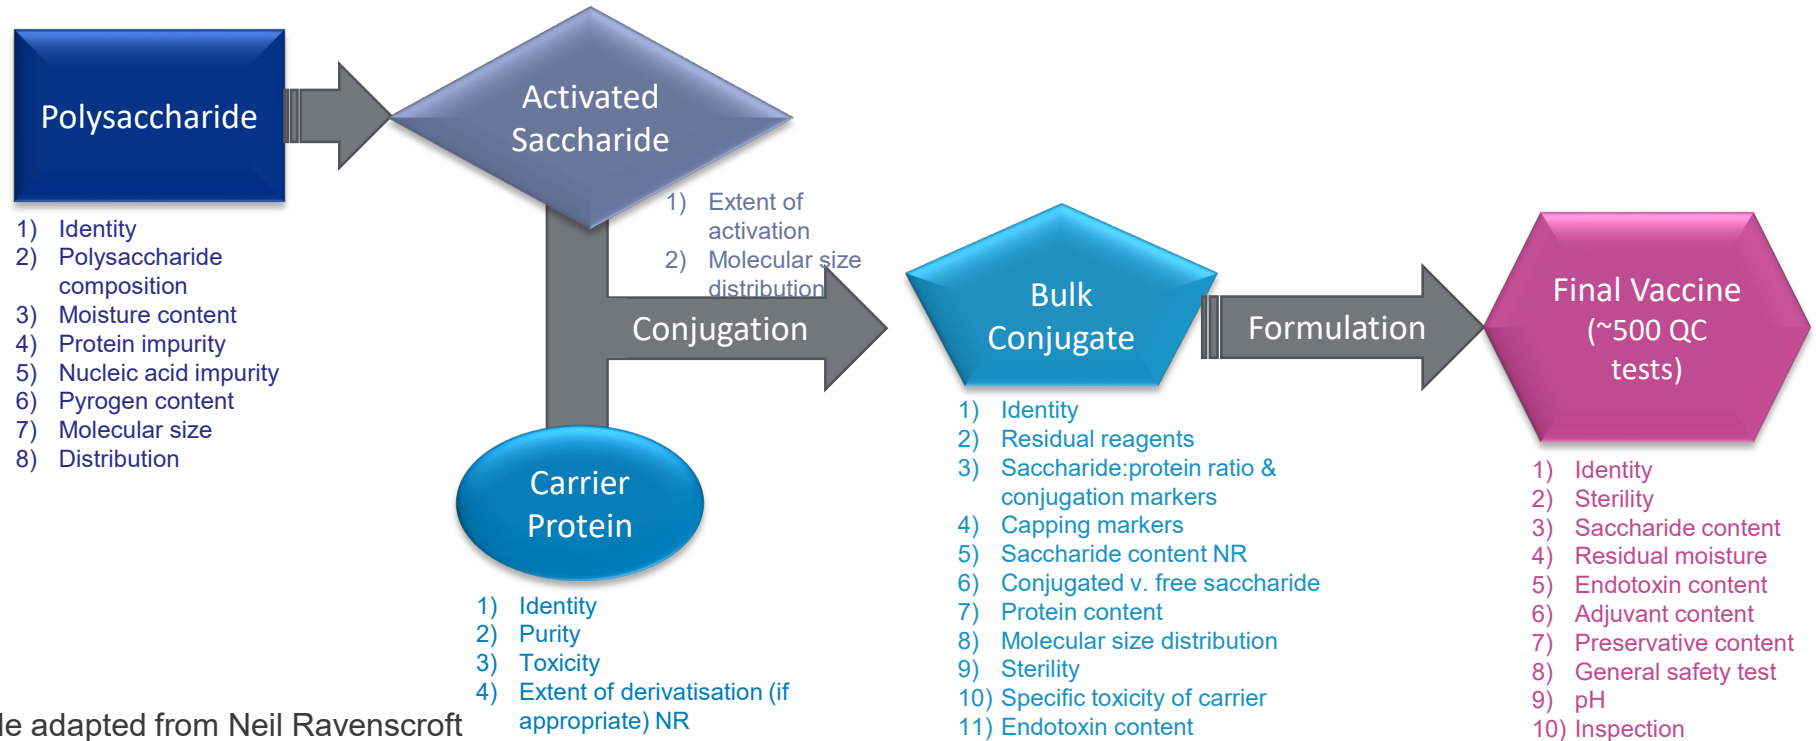

\$180 per PCV13 dose (3-4  
doses per child)

## 3. Immunogenicity does not always imply clinical efficacy

Serotype 3 – no efficacy  
Serotype 19A/F -- resurgence

# Hundreds of Quality Control Tests Required for Conjugate Vaccine

Slide adapted from Neil Ravenscroft

# A potential alternative: Killed whole cell pneumococcal vaccine (WCV)

First pneumococcal vaccine: Killed whole cells (ca. 1911)  
Revisited in 1996 by Porter Anderson (+ student)  
Support from MRF, NIH, BMGF, PATH

## First observations (ca. 2000)

Protection by unencapsulated antigen  
against pneumonia/sepsis with  
encapsulated type 3 SP (intrathoracic  
injection)

**Antibody-mediated (noncapsular)**

Identified several antigens that mediate  
protection against sepsis

Malley, Lipsitch, Anderson, 2001

## First observations (ca. 2000)

# Herd Immunity: 2/3 of the invasive disease reduction in US following introduction of PCV

FIGURE 2. Estimated number of cases of vaccine-type (VT) invasive pneumococcal disease (IPD) prevented by direct\* and indirect† effects of pneumococcal conjugate vaccine (PCV7) — Active Bacterial Core surveillance, United States, 2003

Reingold et al. *MMWR* 2005

With capsular-based vaccines, reduction in colonization in infants and toddlers, and thus transmission to the elderly, is via serotype-specific antibodies (i.e., capsule-type dependent).

There is no capsule (no polysaccharide) in the WCV. So, what is the mechanism of protection?

# What is the mechanism of protection against mouse nasopharyngeal pneumococcal carriage?

We were frustrated early on by our inability to identify antibodies derived from animals immunized with the WCV that could protect against carriage. This led us to question whether antibodies played any role in protection.

# CD4+ Th17 responses help control mucosal colonization by encapsulated organisms

# CD4+ Th17 responses help control mucosal colonization by encapsulated organisms

# WCV-induced protection against carriage represents reduction in duration of carriage

Lu et al, PLoS Path, 2008

# WCV-induced protection against carriage represents reduction in duration of carriage, as seen in children

Lu et al, PLoS Path, 2008

TABLE 2. Observed duration of nasopharyngeal carriage of PNSP for all cases

Serogroup	Mean duration (days) (95% CI)						All cases (n = 2,174)
	<1 yr (n = 79)	1–2 yr (n = 715)	3–4 yr (n = 632)	5–6 yr (n = 339)	7–18 yr (n = 153)	>18 yr (n = 256)	
All (n = 2,174)	74 (61–93)	47 (44–51)	34 (31–37)	26 (23–28)	26 (22–30)	25 (22–28)	37 (35–38)
6 (n = 192)	143 (80–298)	62 (51–77)	55 (43–73)	19 (12–35)	28 (17–52)	27 (17–47)	56 (49–65)
9 (n = 1125)	51 (35–80)	37 (33–41)	31 (28–34)	26 (23–30)	20 (17–25)	23 (20–27)	30 (28–32)
14 (n = 147)	49 (28–102)	41 (31–54)	30 (23–40)	23 (14–42)	43 (23–93)	24 (16–38)	34 (29–40)
15 (n = 156)	82 (44–180)	49 (37–67)	35 (27–47)	24 (18–34)	42 (23–94)	35 (21–65)	39 (34–46)
19 (n = 265)	96 (57–184)	54 (45–65)	34 (27–42)	23 (16–32)	36 (20–74)	31 (21–48)	43 (39–49)
23 (n = 183)	74 (45–133)	67 (54–84)	35 (27–47)	30 (20–47)	27 (14–61)	25 (15–44)	50 (43–58)

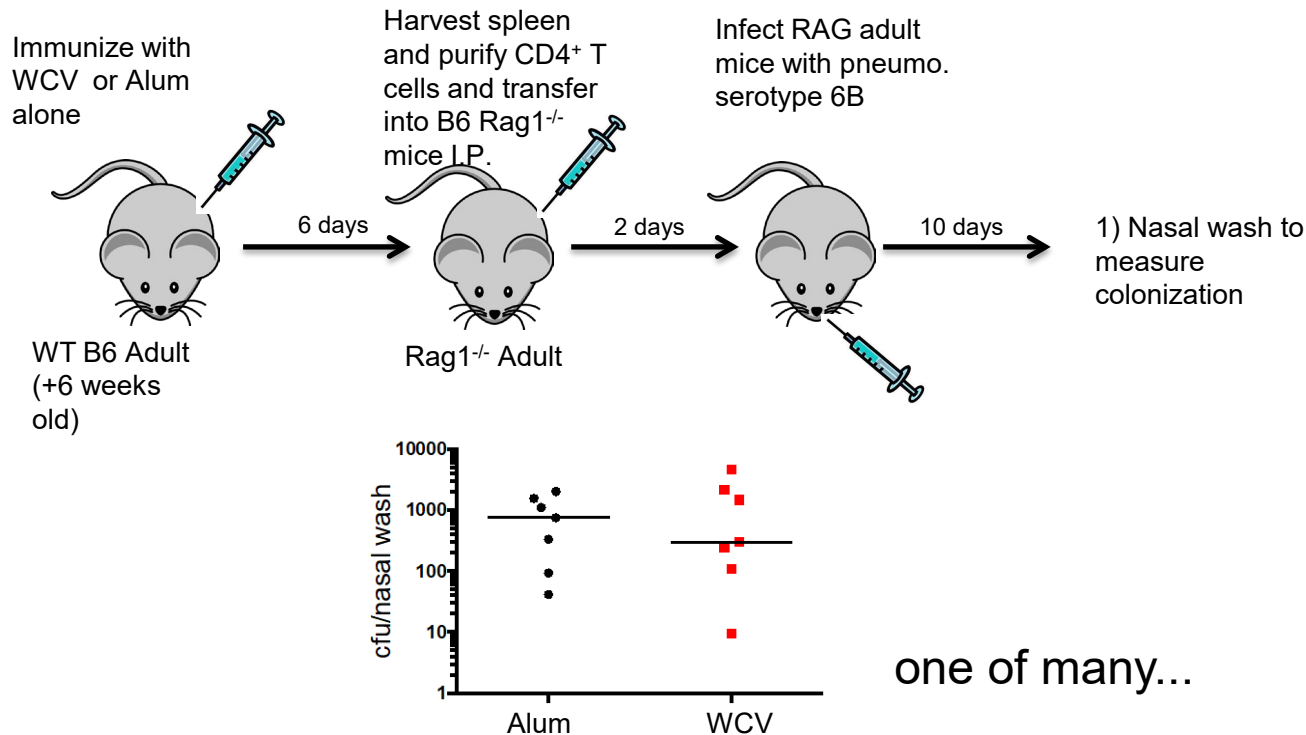

Hogberg L, JCM, 2007

# Where are these T cells?

## Multiple adoptive transfer experiments: failed

# Tissue residency: Protection against colonization is abrogated by CD<sub>4</sub> depletion but unaffected by FTY720 treatment

O'Hara et al., Mucosal Immunology, Jan 2020

## 20 years of work summarized in one slide

- Rationale for WCV very strong, supported by BMGF, PATH, MRF, NIH, even FDA
- Very strong preclinical evidence in support
- Simplicity of manufacture, stability of product > years, very low cost of goods
- Phase 1 trial in adults in US very encouraging
- Phase II trials (2) in Kenya:
  - A bit of a mess
  - Inconclusive
- Most recently, program resurrected in collaboration with Michael Pichichero (Rochester) and Serum Institute of India, funding from NIAID

## Part 3: Development of novel vaccine platform: MAPS

- We and others observed that the WCV was significantly more immunogenic than soluble proteins, potentially due to its particulate nature
- We reasoned that the use of larger complexes may mimic the increased immunogenicity of the WCV, including both B- and T-cell responses, without the complexity of a whole cell antigen

# The Multiple Antigen Presenting System (MAPS)

## Conventional Conjugate Vaccine “Spaghetti and Meatballs”

## MAPS™ Vaccine “Beads on a String”

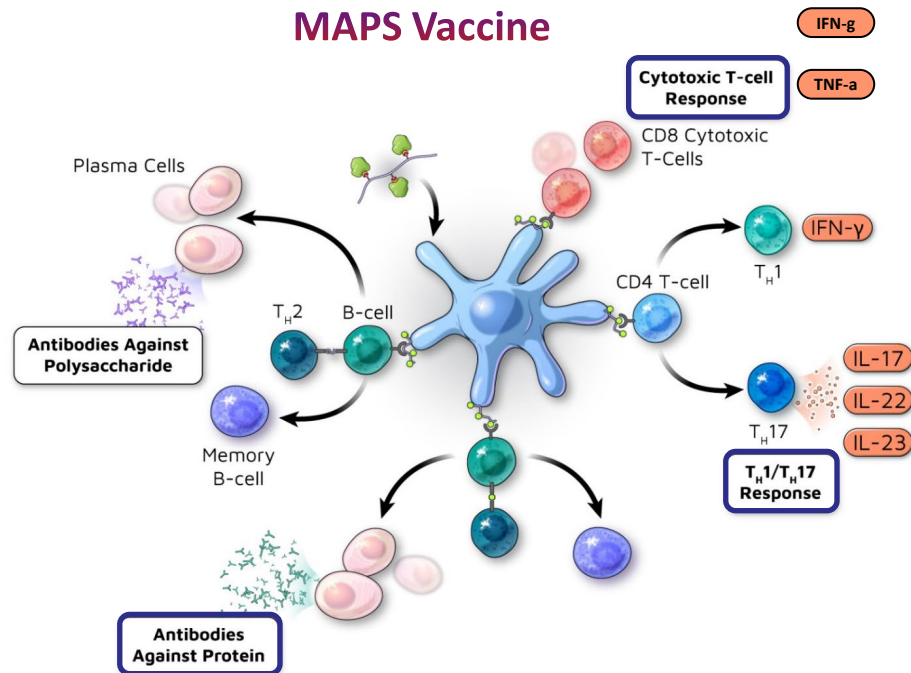

Conjugate vaccine provides only antibody-mediated immunity

## MAPS Vaccine

MAPS vaccine candidates are designed to provide both antibody- and cell-mediated immunity

## Applications of MAPS investigated to date

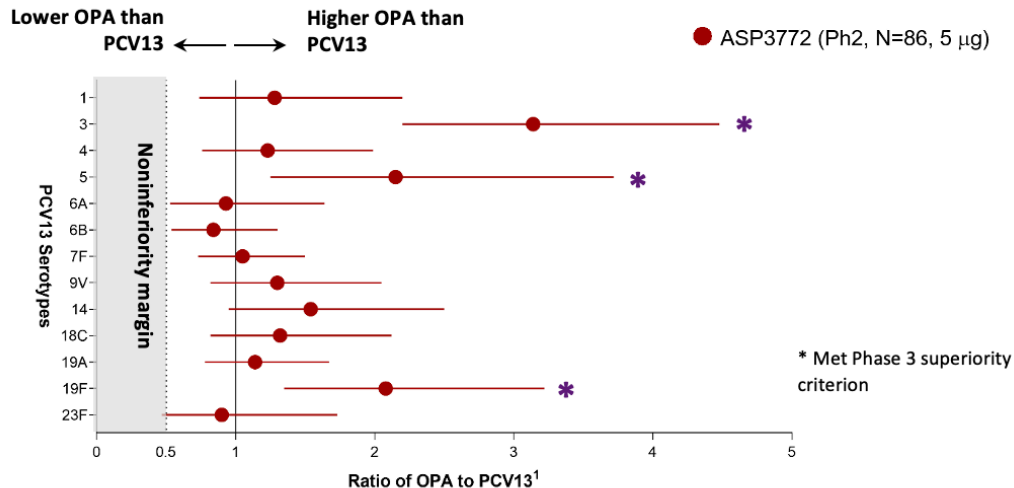

1. *S. pneumoniae* (Phase 2 clinical trial completed in older adults, pending in infants)
  2. *Mycobacterium tuberculosis*
  3. *Salmonella typhi* and *paratyphi*
  4. *Shigella* (4)
  5. *Staphylococcus aureus*
  6. Group A *Streptococcus*
  7. Group B *Streptococcus* (7-valent)
  8. Nosocomial GNR (PSA (8), *Klebsiella* (4) – 8 valent )
- } 8 valent

# 24-valent Pneumococcal MAPS: Phase 2 older adult trial

## ASP3772 OPA Ratio to Prevnar 13 (PCV13) in Older Adults (aged 65 – 85)

Phase 2 infants in process  
Phase 3 older adults in planning

MAPS30+ under development

# What about *S. aureus*?

# *Staphylococcus aureus*

## Staphylococcus aureus is an important human pathogen

- Colonizes 20-50% of the human population at any given time
- Causes a variety of diseases, including soft tissue infections, sepsis, pneumonia, endocarditis...
- Dramatic increase of cases caused by MRSA infection in the past decade (recent decline)

# *Staphylococcus aureus*

## Staphylococcus aureus is an important human pathogen

- Colonizes 20-50% of the human population at any given time
- Causes a variety of diseases, including soft tissue infections, sepsis, pneumonia, endocarditis...
- Dramatic increase of cases caused by MRSA infection in the past decade (recent decline)

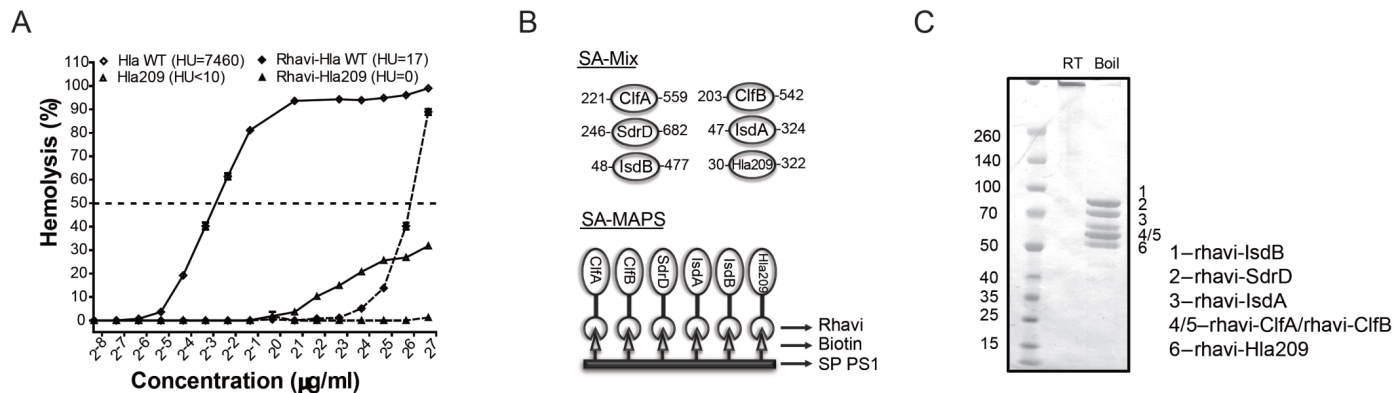

## The development of vaccines against *S. aureus* has not been successful to date

- Pathogenesis is not well understood
- Mechanism of protection is not well understood
- A vaccine trial (Merck) was associated with increased mortality in recipients
  - Association between mortality and low Th17 responses
- More recently, Pfizer's vaccine trial (2 PS, 2 proteins) and GSK trials (2 PS, 2 proteins) were discontinued due to futility

## Role of B- and T-cell immunity in protection?

To understand which component of the acquired immune response was contributing to protection, two complementary strategies were used:

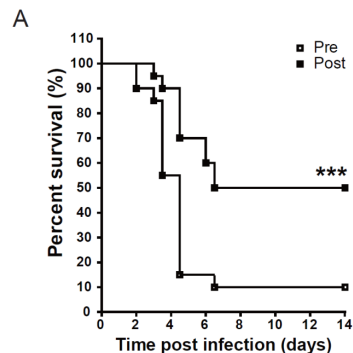

1. Passive transfer of rabbit-generated high-titered antibodies to mice
2. Immunization of  $\mu\text{MT}^{-/-}$  (congenitally antibody-deficient) mice with MAPS followed by challenge

# Protection by passive transfer of antibodies

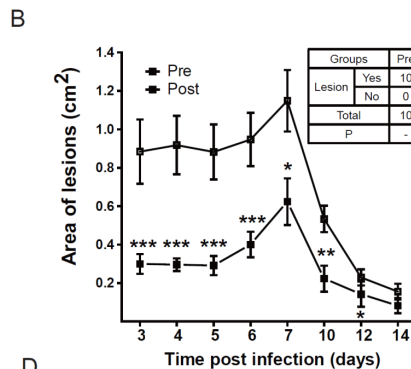

Sepsis

# Strength of binding between PS and protein impacts the magnitude of MAPS-induced anti-PS responses

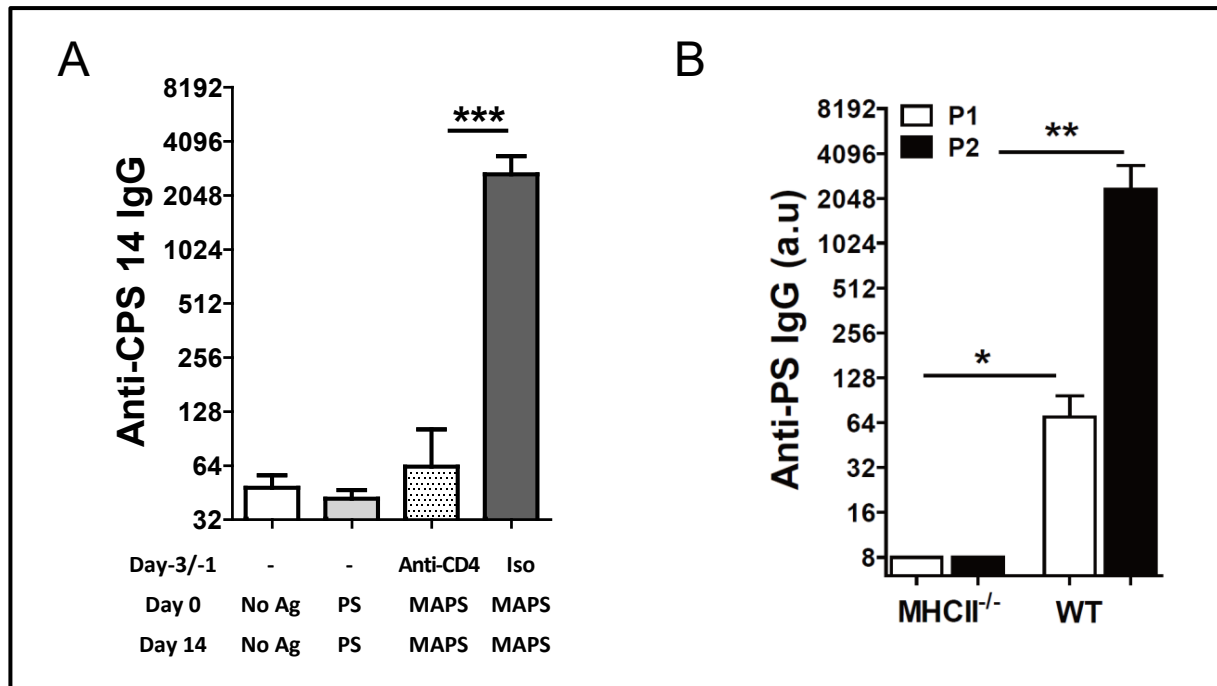

# MAPS elicits robust anti-PS IgG Ab with affinity maturation

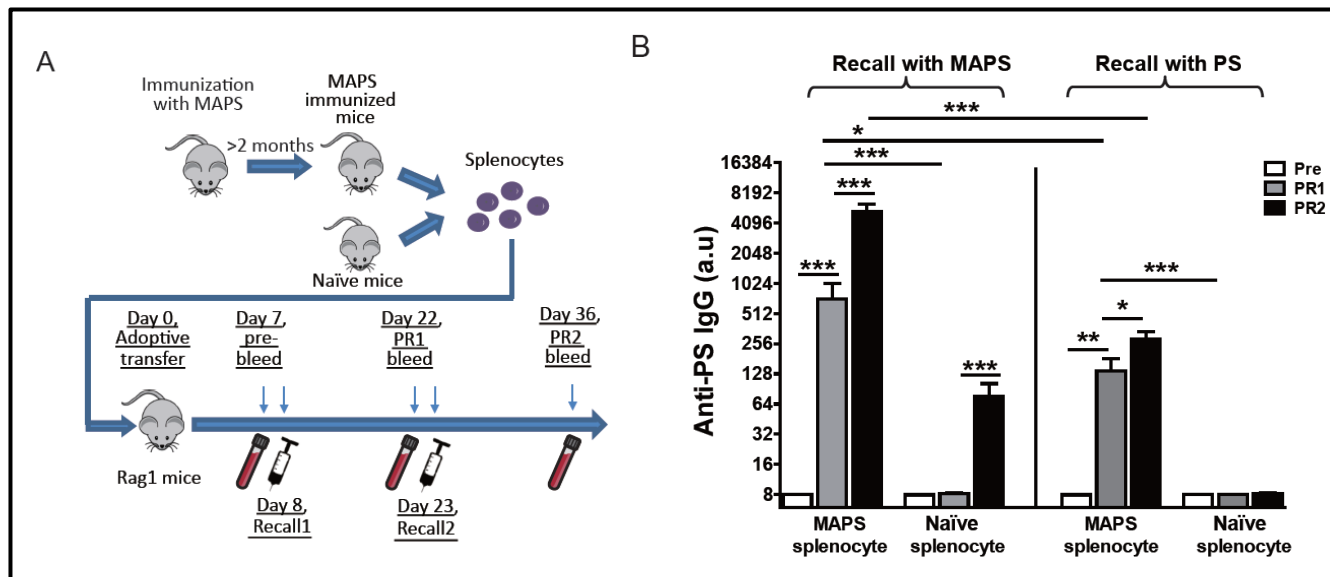

# MAPS-induced PS-specific responses are CD<sub>4</sub><sup>+</sup> T-cell- and MHCII-dependent

# MAPS-induced PS-specific immune memory can be adoptively transferred

➤ Generate a multicomponent TB MAPS vaccine that induces multipronged antigen-specific humoral and cellular responses

- Biotinylated pneumococcal type1 CPS
- Rhavi-ESAT6-CFP10-MPT64
- Rhavi-TB9.8-TB10.4-MPT83
- **Lipo-rhavi (a TLR2 agonist)**
- Rhavi-MPT51

TB MAPS complex

- Antibodies
- Systemic cellular responses
  - Th1, Th17, CTL (CD4 and CD8)
- Tissue resident cellular responses (lungs and nasal tissues)
  - Th1, Th17, CTL (CD4 and CD8)
  - $\gamma\delta$ T cells and NKT cells

O'Hara...Thompson, Lu, Rubin, Malley, Zhang et. al., mBio 2023

# TB MAPS induces systemic Th<sub>1</sub>, Th<sub>17</sub>, and cytotoxic CD<sub>4</sub> and CD<sub>8</sub> memory T cells in mice

A

B

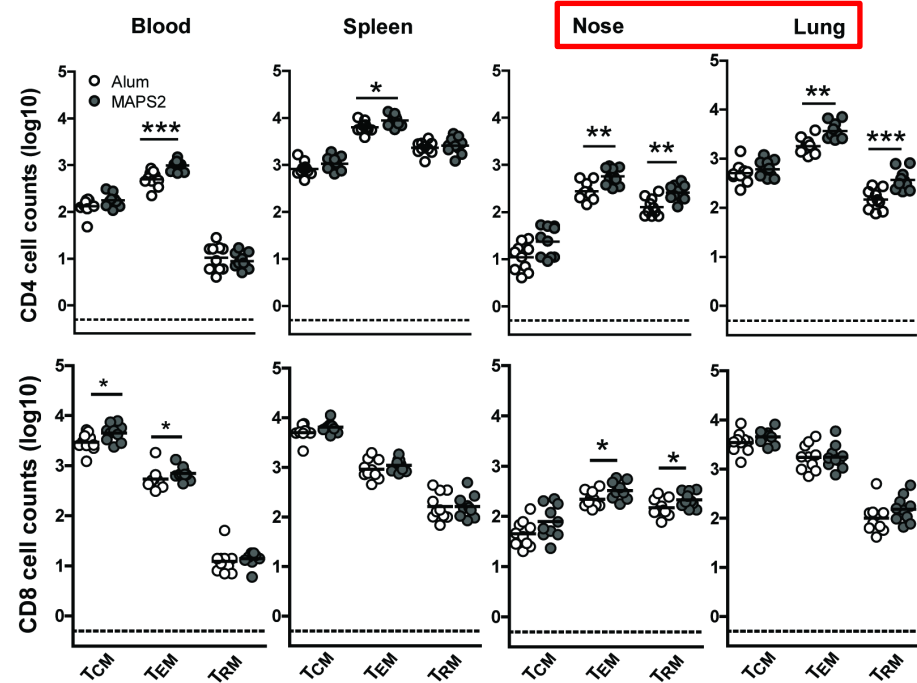

- Isolated cells were incubated without (un) or with (S) a mixture of recombinant Mtb protein antigens overnight at 37 C
- Panel A: representative plots of cytokine-producing splenic CD<sub>4</sub> T cells after stimulation with Mtb protein antigens
- Panel B: absolute counts of cytokine-producing CD<sub>4</sub> or CD<sub>8</sub> T-cells in 1/80 of total isolated splenocytes

# TB MAPS induces tissue-resident $CD4^+$ and $CD8^+$ T cells in lung and nasal tissues of mice

Representative plot of lung T cells

- C57Bl6 mice received three subcutaneous immunization with a TB MAPS vaccine.
- Flow cytometry analysis was done 6 months after the third immunization.

# Combined use of TB MAPS and BCG provides significantly enhanced protection in mice compared to either vaccine used alone

A

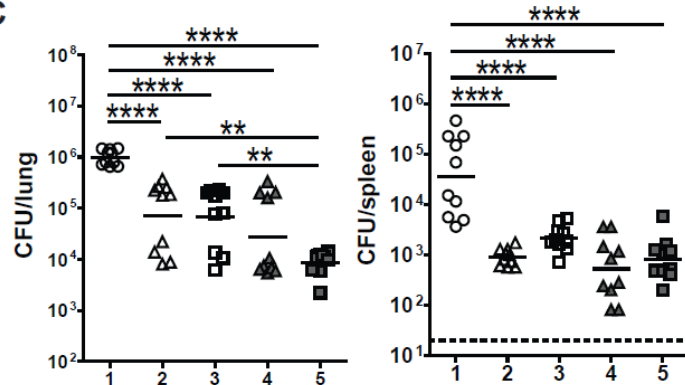

Immunizations	Group 1	Group 2	Group 3	Group 4	Group 5
1st	Saline	BCG	MAPS2	BCG	BCG+MAPS2
2nd	Alum	Alum	MAPS2	MAPS2	MAPS2
3rd	Alum	Alum	MAPS2	MAPS2	MAPS2

Note:  
BCG+MAPS=  
concurrent  
immunization at  
different sites

B

C

- Panel B: whole blood samples were stimulated with Mtb lysates.

# Nonhuman primate study

## Groups

Groups	Treatment	Animal #	PET/CT(Total)
G1	None	n=7	6
G2	BCG	n=7	6
G3	BCG +TB MAPS (once) followed by 2 TB MAPS	n=8	6

## Schedule

- NHP immunized every 4 weeks as needed
- 4 weeks after last immunization, challenged with 10-100 Mtb (Erdman) via bronchoscope
- Blood, BAL obtained at several timepoints during infection, for assays including T cell studies

## Results of NHP study
